Question 1

Flag question

Correct

Status Finished

Duration 10 mins 53 secs

Example

arr=[1,2,3,4,6]

Function Description

Started Thursday, 16 January 2025, 3:13 PM

right are equal. The array may not be reordered.

The index of the pivot is 3.

the sum of the first three elements, 1+2+3=6. The value of the last element is 6.

Using zero based indexing, arr[3]=4 is the pivot between the two subarrays.

Given an array of numbers, find the index of the smallest array element (the pivot), for which the sums of all elements to the left and to the

Completed Thursday, 16 January 2025, 3:24 PM

```
Complete the function balancedSum in the editor below.
                    balancedSum has the following parameter(s):
                    int arr[n]: an array of integers
                    Returns:
                    int: an integer representing the index of the pivot
                    Constraints
                          3 \le n \le 10^5
                          1 \le arr[i] \le 2 \times 10^4, where 0 \le i < n
                          It is guaranteed that a solution always exists.
                    Input Format for Custom Testing
                    Input from stdin will be processed as follows and passed to the function.
                    The first line contains an integer n, the size of the array arr.
                    Each of the next n lines contains an integer, arr[i], where 0 \le i < n.
                    Sample Case 0
                    Sample Input 0
                    STDIN Function Parameters
                    4 \rightarrow arr[] size n = 4
                    1 \rightarrow arr = [1, 2, 3, 3]
                    2
                    3
                    3
                    Sample Output 0
                    2
                    Explanation 0
                          The sum of the first two elements, 1+2=3. The value of the last element is 3.
                          Using zero based indexing, arr[2]=3 is the pivot between the two subarrays.
                          The index of the pivot is 2.
                    Sample Case 1
                    Sample Input 1
                    STDIN Function Parameters
                    3 \rightarrow arr[] size n = 3
                    1 \rightarrow arr = [1, 2, 1]
                    Sample Output 1
                    Explanation 1
                          The first and last elements are equal to 1.
                          Using zero based indexing, arr[1]=2 is the pivot between the two subarrays.
                          The index of the pivot is 1.
                    Answer: (penalty regime: 0 %)
                      Reset answer
                             * Complete the 'balancedSum' function below.
                        3
                             * The function is expected to return an INTEGER.
                             * The function accepts INTEGER_ARRAY arr as parameter.
                        7
                        8
                            int balancedSum(int arr_count, int* arr)
                        9
                       10
                                int totalSum = 0;

Question 2
                    Calculate the sum of an array of integers.
Correct
Flag question
                    Example
                    numbers = [3, 13, 4, 11, 9]
                    The sum is 3 + 13 + 4 + 11 + 9 = 40.
                    Function Description
                    Complete the function arraySum in the editor below.
                    arraySum has the following parameter(s):
                    int numbers[n]: an array of integers
                    Returns
                    int: integer sum of the numbers array
                    Constraints
                    1 \le n \le 10^4
                    1 \le \text{numbers}[i] \le 10^4
                    Input Format for Custom Testing
                    Input from stdin will be processed as follows and passed to the function.
                    The first line contains an integer n, the size of the array numbers.
                    Each of the next n lines contains an integer numbers[i] where 0 \le i < n.

Question 3
                    Given an array of n integers, rearrange them so that the sum of the absolute differences of all adjacent elements is minimized. Then, compute
Correct
                    the sum of those absolute differences. Example n = 5 arr = [1, 3, 3, 2, 4] If the list is rearranged as arr' = [1, 2, 3, 3, 4], the absolute differences
                    are |1-2|=1, |2-3|=1, |3-3|=0, |3-4|=1. The sum of those differences is 1+1+0+1=3. Function Description Complete the function
Flag question
                    minDiff in the editor below. minDiff has the following parameter: arr: an integer array Returns: int: the sum of the absolute differences of
                    adjacent elements Constraints 2 \le n \le 105 0 \le arr[i] \le 109, where 0 \le i < n Input Format For Custom Testing The first line of input contains an
                    integer, n, the size of arr. Each of the following n lines contains an integer that describes arr[i] (where 0 ≤ i < n). Sample Case 0 Sample Input
                    For Custom Testing STDIN Function ---- 5 \rightarrow arr[] size n = 5 5 \rightarrow arr[] = [5, 1, 3, 7, 3] 1 3 7 3 Sample Output 6 Explanation n = 5 arr =
                    [5, 1, 3, 7, 3] If arr is rearranged as arr' = [1, 3, 3, 5, 7], the differences are minimized. The final answer is |1 - 3| + |3 - 3| + |3 - 5| + |5 - 7| = 6.
                    Sample Case 1 Sample Input For Custom Testing STDIN Function ---- 2 → arr[] size n = 2 3 → arr[] = [3, 2] 2 Sample Output 1
                    Explanation n = 2 arr = [3, 2] There is no need to rearrange because there are only two elements. The final answer is |3 - 2| = 1.
                    Answer: (penalty regime: 0 %)
                      Reset answer
